

Question 1 :

A QA engineer tests a login page by entering valid and invalid usernames and passwords without looking at the source code.

Another engineer reviews the actual program code to ensure the password validation logic is implemented correctly.

1. Identify the testing method used in each scenario.
2. Explain the key difference between the two testing approaches.
3. Which testing approach is usually used by developers?

Question 2:

A company has an e-commerce website with 1000 test cases that must be executed every time a new version of the system is released.

1. Should the company rely more on manual testing or automated testing? Explain why.
2. Identify two advantages of automated testing.
3. Give one situation where manual testing is still necessary.
